RELEASE NOTES

PC300 CONTROL/INTERFACE SOFTWARE – Vers.1.04

1. *Auto-start P/P modes* are now also supported via serial port A. In previous versions, they were supported only via the parallel port.

2. The *data output port*, which had in the past always been assigned to serial port C, can now be assigned to either serial port C (default) or serial port A.

3. The default configuration file has been modified to ensure grid patterns, event markers, and time markers have an acceptable number of dots on.

4. Problem correction: In the *general configuration* form, modification of the *event marker pattern* would actually change the *time marker pattern* in PC300's own configuration. (The correct command and argument were sent out to the GP300.)
